Key Concepts in Machine Learning

Machine Learning

- **Machine learning** is a method of ~~data~~ analysis that automates analytical model building.
- It is a **branch** of artificial intelligence based on the idea that systems can learn from data, identify patterns and make decisions with minimal human intervention.

Key Concepts in Machine Learning

Machine Learning

- **Machine learning** is a method of data analysis that **automates** analytical model building.
- It is a **branch** of **artificial intelligence** based on the idea that systems can **learn from data**, **identify patterns** and **make decisions** with minimal human intervention.

- ① • **Supervised Learning:** The model is trained on labeled data.

- **Unsupervised Learning:** The model is trained on unlabeled data.
- **Reinforcement Learning:** The model learns by interacting with an environment.

Algorithmic Bias

- **Algorithmic bias** is a **systematic error** in a model that results in **unfair outcomes**.
- It can be caused by **biased training data**, biased algorithms, or biased decision-making.

Python Tools for Machine Learning

Python Tools

- **NumPy**: A library for numerical computing.
- **Pandas**: A library for data manipulation and analysis.
- **Matplotlib**: A library for data visualization.
- **Scikit-learn**: A library for machine learning.

Jupyter Notebooks

- **Jupyter Notebooks** are a **web-based interactive computing environment** that allows you to create and share documents that contain **live code**, **equations**, **visualizations**, and **narrative text**.
- Jupyter Notebooks are used for data cleaning, data transformation, statistical modeling, data visualization, machine learning, and more.
- Jupyter Notebooks support multiple programming languages, including Python, R, and Julia.
- Jupyter Notebooks are used by data scientists, researchers, students, and educators to explore data, create reports, and teach programming.

Lambda Functions

Definition

A **lambda function** is a small anonymous function. A **lambda function** can take any number of arguments, but can only have one expression.

Numerical Python Library — Numpy

- **Numpy** is the [core](#) library for [scientific computing](#) in Python. It is the [fundamental package](#) for scientific computing with [Python](#).
- **Numpy** is a general-purpose [array-processing](#) package. It provides a [high-performance](#) multidimensional array object, and tools for working with these arrays.
- **Numpy** was created by [Travis Oliphant](#) in 2005, and it is an [open-source project](#). Coming soon, [Numpy version 2.0](#) will be released.

Lineal Algebra with Numpy

- **Numpy** provides a **comprehensive set** of **linear algebra** functions.
- **Numpy** provides the functionality to create and manipulate matrices.
- **Numpy** provides the functionality to solve linear systems of equations.
- **Numpy** provides the functionality to calculate the determinant of a matrix.
- **Numpy** provides the functionality to calculate the inverse of a matrix.

Lineal Algebra with Numpy

- **Numpy** provides a **comprehensive set** of **linear algebra** functions.
- **Numpy** provides the **functionality** to **create** and **manipulate matrices**.
- **Numpy** provides the **functionality** to solve linear systems of equations.
- **Numpy** provides the **functionality** to calculate the **determinant** of a matrix.
- **Numpy** provides the **functionality** to calculate the **inverse** of a matrix.

- **Numpy** provides the **functionality** to **calculate** the **determinant** of a matrix.
- **Numpy** provides the **functionality** to **calculate** the **inverse** of a matrix.

Vectorization with Numpy

- **Vectorization** is the **process** of **converting** an **algorithm** from **operating** on a single value at a time to **operating** on a set of values at one time.
- **Vectorization** is the **process** of **replacing** explicit **loops** with **array expressions** or **matrix operations**.
- The advantages of vectorization are speed and clarity. The disadvantages are memory and complexity.
- **Numpy** provides the functionality to vectorize operations on arrays.

Vectorization with Numpy

- **Vectorization** is the **process** of **converting** an **algorithm** from **operating** on a single value at a time to **operating** on a set of values at one time.

- The **advantages** of **vectorization** are **speed** and **clarity**. The **disadvantages** are **memory** and **complexity**.
- **Numpy** provides the **functionality** to **vectorize operations** on **arrays**.

Introduction to Pandas

- **Pandas** is a **fast**, **powerful**, **flexible**, and **easy-to-use open-source data manipulation** and **data analysis** library built on top of the **Python** programming language.
- **Pandas** is a **high-level data manipulation** tool developed by **Wes McKinney** in 2008.
- **Pandas** is a **fast** and **efficient data manipulation** tool that is **built** on top of **NumPy**.
- **Pandas** is one of the most **popular** and **widely-used data manipulation** libraries in the **world**.

The “Series” Data Structure

- A **Series** is a **one-dimensional array-like object** that contains a **sequence of values** and an **associated array of data labels**, called the **index**.
- The **index** of a **Series** is an **array of labels** that **correspond** to the **values** in the **Series**. The **index** of a **Series** is an **optional parameter** that **defaults** to a **sequence of integers** starting at **zero**.
- The **Series object** is a **core data structure** in **Pandas**.

Querying a Series

- You could **query** a **Series** using **indexing** (**boolean** or **fancy**).
- You could **query** a **Series** using **loc** and **iloc** indexers.

Querying a Series

- You could **query** a **Series** using **indexing** (**boolean** or **fancy**).
- You could **query** a **Series** using **loc** and **iloc** indexers.

The “DataFrame” Data Structure

- A **DataFrame** is a two-dimensional labeled data structure with columns of potentially different types.
- A **DataFrame** is a tabular data structure that is similar to a spreadsheet or a SQL table.
- A **DataFrame** is a core data structure in **Pandas**. It is a two-dimensional size-mutable data structure with labeled axes (rows and columns).
- A **DataFrame** is a container for Series objects.

DataFrame Indexing and Loading

- You could **index** a **DataFrame** using **column names**.
- You could **load** a **DataFrame** from a **CSV** file.
- You could **load** a **DataFrame** from a **JSON** file.
- You could **load** a **DataFrame** from a **SQL** database.

DataFrame Indexing and Loading

- You could **index** a **DataFrame** using **column names**.
- You could **load** a **DataFrame** from a **CSV file**.
- You could **load** a **DataFrame** from a **JSON file**.
- You could **load** a **DataFrame** from a **SQL database**.

DataFrame Indexing and Loading

- You could **index** a **DataFrame** using **column names**.
- You could **load** a **DataFrame** from a **CSV file**.
- You could **load** a **DataFrame** from a **JSON file**.
- You could **load** a **DataFrame** from a **SQL database**.

DataFrame Indexing and Loading

- You could **index** a **DataFrame** using **column names**.
- You could **load** a **DataFrame** from a **CSV file**.
- You could **load** a **DataFrame** from a **JSON file**.
- You could **load** a **DataFrame** from a **SQL database**.

DateTime Handling in Pandas

- You could **convert** a **string** to a **datetime** object using the **to_datetime()** method.
- You could **convert** a **datetime** object to a **string** using the **strftime()** method.
- You could **convert** a **datetime** object to a **timestamp** using the **timestamp()** method.

DateTime Handling in Pandas

- You could **convert** a **string** to a **datetime** object using the **to_datetime()** method.
- You could **convert** a **datetime** object to a **string** using the **strftime()** method.
- You could **convert** a **datetime** object to a **timestamp** using the **timestamp()** method.

DateTime Handling in Pandas

- You could **convert** a **string** to a **datetime** object using the **to_datetime()** method.
- You could **convert** a **datetime** object to a **string** using the **strftime()** method.
- You could **convert** a **datetime** object to a **timestamp** using the **timestamp()** method.

Querying a DataFrame

- You could **query** a **DataFrame** using **indexing** (**boolean** or **fancy**).
- You could **query** a **DataFrame** using **loc** and **iloc** indexers.
- You could **query** a **DataFrame** using **query** method.

Querying a DataFrame

- You could **query** a **DataFrame** using **indexing** (**boolean** or **fancy**).
- You could **query** a **DataFrame** using **loc** and **iloc** indexers.
- You could **query** a **DataFrame** using **query** method.

Querying a DataFrame

- You could **query** a **DataFrame** using **indexing** (**boolean** or **fancy**).
- You could **query** a **DataFrame** using **loc** and **iloc** indexers.
- You could **query** a **DataFrame** using **query method**.

Missing Values in a DataFrame

- You could **detect** missing values in a **DataFrame**. The **isnull()** method returns a **Boolean DataFrame** indicating the **presence** of missing values.
- You could **fill** missing values in a **DataFrame**. The **fillna()** method returns a **DataFrame** with missing values filled.
- You could **drop** missing values in a **DataFrame**. The **dropna()** method returns a **DataFrame** with missing values dropped.

Missing Values in a DataFrame

- You could **detect** missing values in a **DataFrame**. The **isnull()** method returns a **Boolean DataFrame** indicating the **presence** of missing values.
- You could **fill** missing values in a **DataFrame**. The **fillna()** method returns a **DataFrame** with missing values filled.
- You could **drop** missing values in a **DataFrame**. The **dropna()** method returns a **DataFrame** with missing values dropped.

Missing Values in a DataFrame

- You could **detect** missing values in a **DataFrame**. The **isnull()** method returns a **Boolean DataFrame** indicating the **presence** of missing values.
- You could **fill** missing values in a **DataFrame**. The **fillna()** method returns a **DataFrame** with missing values filled.
- You could **drop** missing values in a **DataFrame**. The **dropna()** method returns a **DataFrame** with missing values dropped.

Merging DataFrames

- You could **merge** two **DataFrames** using the **merge()** method.
- You could **concatenate** two **DataFrames** using the **concat()** method.
- You could **join** two **DataFrames** using the **join()** method.

Merging DataFrames

- You could **merge** two **DataFrames** using the **merge()** method.
- You could **concatenate** two **DataFrames** using the **concat()** method.
- You could **join** two **DataFrames** using the **join()** method.

Merging DataFrames

- You could **merge** two **DataFrames** using the **merge()** method.
- You could **concatenate** two **DataFrames** using the **concat()** method.
- You could **join** two **DataFrames** using the **join()** method.

GroupBy in Pandas

- You could **group** a **DataFrame** using the **groupby()** method.
- You could **aggregate** a **DataFrame** using the **agg()** method.
- You could **transform** a **DataFrame** using the **transform()** method.
- You could **filter** a **DataFrame** using the **filter()** method.

GroupBy in Pandas

- You could **group** a **DataFrame** using the **groupby()** method.
- You could **aggregate** a **DataFrame** using the **agg()** method.
- You could **transform** a **DataFrame** using the **transform()** method.
- You could **filter** a **DataFrame** using the **filter()** method.

GroupBy in Pandas

- You could **group** a **DataFrame** using the `groupby()` method.
- You could **aggregate** a **DataFrame** using the `agg()` method.
- You could **transform** a **DataFrame** using the `transform()` method.
- You could **filter** a **DataFrame** using the `filter()` method.

GroupBy in Pandas

- You could **group** a **DataFrame** using the `groupby()` method.
- You could **aggregate** a **DataFrame** using the `agg()` method.
- You could **transform** a **DataFrame** using the `transform()` method.
- You could **filter** a **DataFrame** using the `filter()` method.

Outline

- 1 Fundamentals of Machine Learning
- 2 Python Tools for Machine Learning
- 3 Supervised Machine Learning**
- 4 Machine Learning Models Evaluation

Introduction to Supervised Machine Learning

Definition

- **Supervised learning** is a type of **machine learning** where the model is trained on **labeled data**.
- It involves training a model to **map input data to output data** based on example **input-output pairs**.

Overfitting and Underfitting

Overfitting

Overfitting occurs when a model learns the training data too well and performs poorly on new data.

Underfitting

Underfitting occurs when a model is too simple to capture the underlying structure of the data.

Overfitting and Underfitting

Overfitting

Overfitting occurs when a model learns the training data too well and performs poorly on new data.

Underfitting

Underfitting occurs when a model is too simple to capture the underlying structure of the data.

Supervised Learning Datasets

- **Training Dataset:** The data used to **train the model**.
- **Validation Dataset:** The data used to **tune the model hyperparameters**.
- **Test Dataset:** The data used to **evaluate the model performance**.

Supervised Learning Datasets

- **Training Dataset:** The data used to **train the model**.
- **Validation Dataset:** The data used to **tune** the model **hyperparameters**.
- **Test Dataset:** The data used to **evaluate** the model **performance**.

Supervised Learning Datasets

- **Training Dataset:** The data used to **train the model**.
- **Validation Dataset:** The data used to **tune** the model **hyperparameters**.
- **Test Dataset:** The data used to **evaluate** the model **performance**.

Cross-Validation

- **Cross-validation** is a technique for **assessing the performance** of a model.
- It involves **splitting** the data into multiple subsets, training the model on some subsets, and evaluating it on others.
- Common cross-validation **techniques** include **k-fold cross-validation** and **leave-one-out cross-validation**.
- Cross-validation helps to **reduce overfitting** and provides a more **accurate estimate** of the model's **performance**.

One-Hot Encoding

One-Hot Encoding

- **One-hot encoding** is a technique for **converting** categorical variables into numerical variables.
- It creates a **binary vector** for each category, with a 1 for the *category* and 0s for all other categories.

Data Leakage

- **Data leakage** occurs when information from the test set is **inadvertently** used to train the model.
- It can lead to **overfitting** and inflated performance metrics.
- Common sources of **data leakage** include **target leakage**, **train-test contamination**, and **information leakage**.
- To prevent **data leakage**, it is important to **carefully separate** the training and test data and avoid using information from the test set during training.

K-Nearest Neighbors: Classification and Regression

- **K-Nearest Neighbors (KNN)** is a simple algorithm that stores all available cases and classifies new cases based on a **similarity measure**.
- It can be used for both **classification** and **regression** tasks.
- For **classification**, the output is the **class label** of the majority of the k-nearest neighbors.
- For **regression**, the output is the **average** of the k-nearest neighbors.

K-Nearest Neighbors: Classification and Regression

- **K-Nearest Neighbors (KNN)** is a simple algorithm that stores all available cases and classifies new cases based on a **similarity measure**.
- It can be used for both **classification** and **regression** tasks.
- For **classification**, the output is the **class label** of the majority of the k-nearest neighbors.
- For **regression**, the output is the **average** of the k-nearest neighbors.

Linear Regression with Least Squares

Linear Regression

- **Linear regression** is a type of **regression analysis** used for predicting the value of a **continuous dependent variable**.
- It works by finding the **line that best fits the data**.

Least Squares

Least squares is a method for finding the **best-fitting line** by **minimizing the sum** of the squared differences between the **predicted** and **actual** values.

Linear Regression with Least Squares

Linear Regression

- **Linear regression** is a type of **regression analysis** used for predicting the value of a **continuous dependent variable**.
- It works by finding the **line that best fits the data**.

Least Squares

Least squares is a method for finding the **best-fitting line** by **minimizing the sum** of the squared differences between the **predicted** and **actual** values.

Ridge & Lasso

Ridge regression & Lasso regression are a type of **linear regression** that includes a penalty term to **prevent overfitting**. It works by adding a **regularization** term to the **least squares objective function**.

Polynomial Regression

Polynomial Regression

- **Polynomial regression** is a type of **regression analysis** that models the relationship between the independent and dependent variables as an **n th-degree polynomial**.
- It can capture **non-linear relationships** between the variables.

Logistic Regression

Logistic Regression

- **Logistic regression** is a type of **regression analysis** used for predicting the outcome of a **categorical dependent variable**.
- It is used for **binary classification** tasks, where the output is a probability between 0 and 1.

Decision Trees

- **Decision trees** are a type of **machine learning model** that can be used for both **classification** and **regression** tasks.
- They work by recursively **partitioning** the data into **subsets** based on the values of the features.

Naive Bayes Classifier

- The **naive Bayes classifier** is a simple probabilistic **classifier** based on **Bayes' theorem**.
- It assumes that the features are **conditionally independent** given the class label.

Random Forest

- **Random forest** is an **ensemble learning** method that combines **multiple decision trees** to create a strong predictive model.
- It works by building **multiple trees** and averaging their predictions to **reduce overfitting**.

Gradient Boosted Decision Trees

- **Gradient boosted decision trees** are an **ensemble learning** method that combines **multiple decision trees** and **gradient descent optimization** to create a strong predictive model.
- They work by building **trees sequentially**, with each tree **correcting the errors** of the previous trees.

Neural Networks

- **Neural networks** are a type of **machine learning model** inspired by the **human brain**.
- They consist of **layers** of interconnected nodes that process **input data** and produce **output data**.

Outline

- 1 Fundamentals of Machine Learning
- 2 Python Tools for Machine Learning
- 3 Supervised Machine Learning
- 4 Machine Learning Models Evaluation**

Model Evaluation & Selection

- **Model Evaluation:** Assessing the **performance** of a model.
- **Model Selection:** Choosing the **best model** for the task.

Confusion Matrices

Definition

- A **confusion matrix** is a **table** that summarizes the **performance** of a **classification model**.
- It shows the number of **true positives**, **true negatives**, **false positives**, and **false negatives**.

Basic Evaluation Metrics

- **Accuracy:** The proportion of correct predictions.
- **Precision:** The proportion of true positives among all positive predictions.
- **Recall:** The proportion of true positives among all actual positives.
- **F1 Score:** The harmonic mean of precision and recall.

Basic Evaluation Metrics

- **Accuracy:** The proportion of correct predictions.
- **Precision:** The proportion of true positives among all positive predictions.
- **Recall:** The proportion of true positives among all actual positives.
- **F1 Score:** The harmonic mean of precision and recall.

Basic Evaluation Metrics

- **Accuracy:** The proportion of correct predictions.
- **Precision:** The proportion of true positives among all positive predictions.
- **Recall:** The proportion of true positives among all actual positives.
- **F1 Score:** The harmonic mean of precision and recall.

Basic Evaluation Metrics

- **Accuracy:** The proportion of correct predictions.
- **Precision:** The proportion of true positives among all positive predictions.
- **Recall:** The proportion of true positives among all actual positives.
- **F1 Score:** The harmonic mean of precision and recall.

Classifier Metrics

- **ROC Curve:** A plot of the true positive rate against the false positive rate.
- Precision-Recall Curve: A plot of precision against recall.
- AUC-ROC: The area under the ROC curve.
- AUC-PR: The area under the precision-recall curve.

Classifier Metrics

- **ROC Curve:** A plot of the true positive rate against the false positive rate.
- **Precision-Recall Curve:** A plot of precision against recall.
- **AUC-ROC:** The area under the ROC curve.
- **AUC-PR:** The area under the precision-recall curve.

Classifier Metrics

- **ROC Curve:** A plot of the true positive rate against the false positive rate.
- **Precision-Recall Curve:** A plot of precision against recall.
- **AUC-ROC:** The area under the ROC curve.
- **AUC-PR:** The area under the precision-recall curve.

Classifier Metrics

- **ROC Curve:** A plot of the true positive rate against the false positive rate.
- **Precision-Recall Curve:** A plot of precision against recall.
- **AUC-ROC:** The area under the ROC curve.
- **AUC-PR:** The area under the precision-recall curve.

Regression Metrics

- **Mean Squared Error:** The **average** of the **squared differences** between the predicted and actual values.
- **Mean Absolute Error:** The **average** of the **absolute differences** between the predicted and actual values.
- **R-Squared:** The **proportion** of the **variance** in the dependent variable that is predictable from the independent variables.
- **Adjusted R-Squared:** A modified version of R-squared that adjusts for the **number of predictors** in the model.
- **Root Mean Squared Error:** The **square root** of the **mean squared error**.

Regression Metrics

- **Mean Squared Error:** The **average** of the **squared differences** between the predicted and actual values.
- **Mean Absolute Error:** The **average** of the **absolute differences** between the predicted and actual values.
- **R-Squared:** The **proportion** of the **variance** in the dependent variable that is predictable from the independent variables.
- **Adjusted R-Squared:** A modified version of R-squared that adjusts for the **number of predictors** in the model.
- **Root Mean Squared Error:** The **square root** of the **mean squared error**.
