# Concepts Generation

- **Concepts generation** is the process of creating ideas for a system that meet the needs of its users.

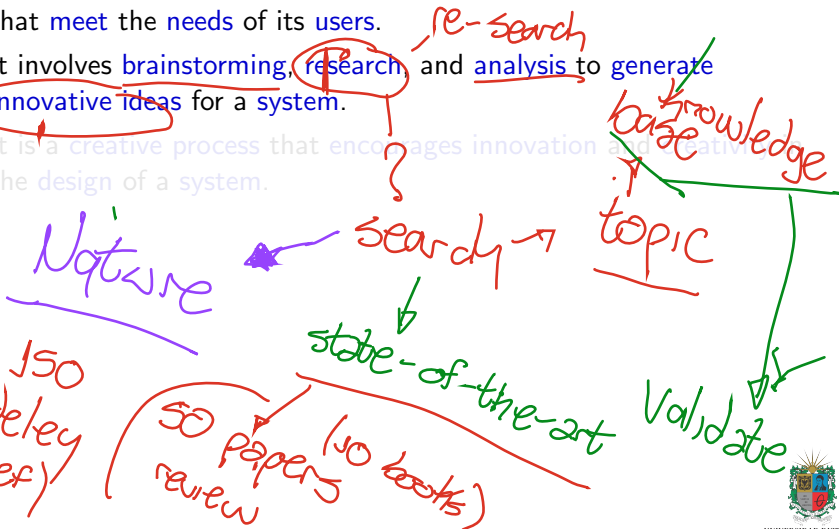

- It involves brainstorming, research and analysis to generate innovative ideas for a system.

- It is a creative process that encourages innovation and creativity in the design of a system.

# Concepts Generation

- **Concepts generation** is the **process** of **creating ideas** for a **system** that **meet** the **needs** of its **users**.
- It involves **brainstorming**, **research**, and **analysis** to **generate innovative ideas** for a **system**.
- It is a creative process that encourages innovation and creativity in the design of a system.

# Concepts Generation

- **Concepts generation** is the process of creating ideas for a system that meet the needs of its users.
- It involves brainstorming, research, and analysis to generate innovative ideas for a system.
- It is a creative process that encourages innovation and creativity in the design of a system.

# Innovation and Creativity

- **Innovation** is the process of creating new ideas and solutions that improve the performance of a system.
- Creativity is the ability to generate original and innovative ideas that solve problems and meet the needs of users.
- They are important for ensuring that a system is robust, efficient, and effective.

# Innovation and Creativity

- **Innovation** is the process of creating new ideas and solutions that improve the performance of a system.
- **Creativity** is the ability to generate original and innovative ideas that solve problems and meet the needs of users.
- They are important for ensuring that a system is robust, efficient, and effective.

# Innovation and Creativity

# Is this Innovation & Creativity?

# Concepts Selection

- **Concepts selection** is the process of evaluating and choosing the best ideas for a system.

- It involves analysis, comparison and evaluation of concepts to determine which ones are the most feasible and effective.
- It is a critical process that ensures that the final design of a system meets the needs of its users.

# Outline

- 1 Concepts Generation & Selection
- 2 Quality Guidelines in Systems Design
- 3 Systems Architectures

# Quality Guidelines

- **Quality guidelines** are **principles** that **guide** the **design** of a **system** to **ensure** that it **meets** the **needs** of its **users**.
- They include **reliability**, **scalability**, **maintainability**, and **usability** guidelines.
- They are important for ensuring that a system is **robust**, **efficient**, and **effective**.

# Quality Guidelines

- **Quality guidelines** are principles that guide the design of a system to ensure that it meets the needs of its users.
- They include reliability, scalability, maintainability, and usability guidelines.
- They are important for ensuring that a system is robust, efficient, and effective.

# Quality Guidelines

- **Quality guidelines** are principles that guide the design of a system to ensure that it meets the needs of its users.
- They include reliability, scalability, maintainability, and usability guidelines.
- They are important for ensuring that a system is robust, efficient, and effective.

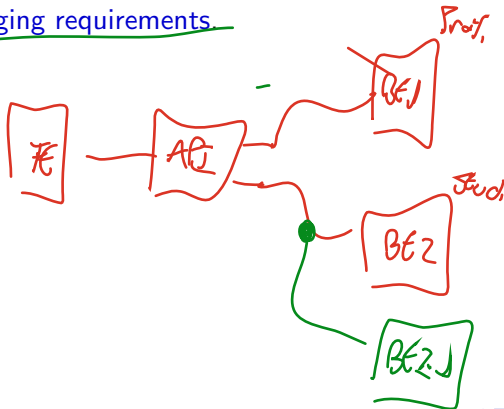

# Reliability Guidelines

- **Reliability guidelines** are principles that guide the design of a system to ensure that it is reliable and dependable.
- They include fault-tolerance, redundancy, and error-handling guidelines.
- They are important for ensuring that a system is robust and resilient to failures.

# Scalability Guidelines

- Scalability guidelines are principles that guide the design of a system to ensure that it is scalable and flexible.
- They include modularity, extensibility, and performance guidelines.
- They are important for ensuring that a system can grow and adapt to changing requirements.

# Maintainability Guidelines

- **Maintainability guidelines** are **principles** that **guide** the **design** of a **system** to **ensure** that it is **easy** to **maintain** and **update**.
- They include **modularity**, **documentation**, and **versioning** guidelines.
- They are **important** for **ensuring** that a **system** can be **easily** **maintained** and **updated** by its **developers**.

Linux v. 24 LTS → 25.04 Beta → 26.04 Beta2

# Quality Standards

- Quality standards are benchmarks that define the level of quality that a system must meet.
- They include ISO 9000, CMMI, and Six Sigma standards.
- They are important for ensuring that a system is robust, efficient, and effective.

# Quality Standards

- **Quality standards** are **benchmarks** that **define** the **level** of **quality** that a **system** must **meet**.
- They include **ISO 9000**, **CMMI**, and **Six Sigma standards**.
- They are important for ensuring that a system is robust, efficient, and effective.

# Quality Standards

- **Quality standards** are **benchmarks** that **define** the **level** of **quality** that a **system** must **meet**.
  - They include **ISO 9000**, **CMMI**, and **Six Sigma** standards.
  - They are **important** for **ensuring** that a **system** is **robust**, **efficient**, and **effective**.
- 

# ISO 9000

- **ISO 9000** is a **quality standard** that defines the requirements for a quality management system.
- It is designed to help organizations ensure that they meet the needs of their customers and stakeholders.
- It is based on a number of quality management principles, including customer focus, leadership, and continuous improvement.

# ISO 9000

- **ISO 9000** is a **quality standard** that **defines** the **requirements** for a **quality management system**.
- It is **designed** to **help organizations ensure** that they **meet** the **needs** of their **customers** and **stakeholders**.
- It is based on a number of quality management principles, including customer focus, leadership, and continuous improvement.

# ISO 9000

- **ISO 9000** is a **quality standard** that **defines the requirements** for a **quality management system**.
- It is **designed to help organizations ensure** that they **meet the needs** of their **customers** and **stakeholders**.
- It is **based** on a **number of quality management principles**, including **customer focus**, **leadership**, and **continuous improvement**.

# ISO 27001

- **ISO 27001** is a **quality standard** that **defines** the **requirements** for an **information security management system**.
- It is designed to help organizations protect their information and ensure that it is secure and confidential.
- It is based on a number of information security management principles, including risk assessment, security policies, and incident response.

# ISO 27001

- **ISO 27001** is a **quality standard** that **defines** the **requirements** for an **information security management system**.
- It is **designed** to **help organizations protect** their **information** and **ensure** that it is **secure** and **confidential**.
- It is based on a number of information security management principles, including risk assessment, security policies, and incident response.

# ISO 27001

- **ISO 27001** is a **quality standard** that **defines** the **requirements** for an **information security management system**.
- It is **designed** to **help organizations protect** their **information** and **ensure** that it is **secure** and **confidential**.
- It is **based** on **a number of information security management principles**, including **risk assessment**, **security policies**, and **incident response**.

# CMMI

- **CMMI** is a **quality standard** that **defines** the **requirements** for a **mature software development process**.
- It is designed to help organizations improve their software development processes and deliver high-quality products to their customers.
- It is based on a number of best practices for software development, including requirements management, project planning, and process monitoring.

# CMMI

- **CMMI** is a quality standard that defines the requirements for a mature software development process.
- It is designed to help organizations improve their software development processes and deliver high-quality products to their customers.
- It is based on a number of best practices for software development, including requirements management, project planning, and process monitoring.

# CMMI

- **CMMI** is a quality standard that defines the requirements for a mature software development process.
- It is designed to help organizations improve their software development processes and deliver high-quality products to their customers.
- It is based on a number of best practices for software development, including requirements management, project planning, and process monitoring.

# Six Sigma

- **Six Sigma** is a quality standard that defines the requirements for a process that is capable of producing high-quality products.
- It is designed to help organizations improve their processes and reduce defects in their products and services.
- It is based on a number of quality management principles, including data-driven decision-making, process improvement, and customer focus.

# Six Sigma

- **Six Sigma** is a quality standard that defines the requirements for a process that is capable of producing high-quality products.
- It is designed to help organizations improve their processes and reduce defects in their products and services.
- It is based on a number of quality management principles, including data-driven decision-making, process improvement, and customer focus.

# Six Sigma

- **Six Sigma** is a quality standard that defines the requirements for a process that is capable of producing high-quality products.
- It is designed to help organizations improve their processes and reduce defects in their products and services.
- It is based on a number of quality management principles, including data-driven decision-making, process improvement, and customer focus.

# Outline

- 1 Concepts Generation & Selection
- 2 Quality Guidelines in Systems Design
- 3 Systems Architectures

# What is a System Architecture?

- A **system architecture** is the **structure** of a **system** that **defines** its **components**, **interactions**, and **relationships**.
- A **system architecture** is the blueprint of a system that guides its development and implementation.
- A **system architecture** is the foundation of a system that ensures that it meets the needs of **complex** users.

# What is a System Architecture?

- A **system architecture** is the **structure** of a **system** that **defines** its **components**, **interactions**, and **relationships**.
- A **system architecture** is the **blueprint** of a **system** that **guides** its **development** and **implementation**.
- A **system architecture** is the foundation of a system that ensures that it **meets** the **needs** of its **users**.

# What is a System Architecture?

- A **system architecture** is the **structure** of a **system** that **defines** its **components**, **interactions**, and **relationships**.
- A **system architecture** is the **blueprint** of a **system** that **guides** its **development** and **implementation**.
- A **system architecture** is the **foundation** of a **system** that **ensures** that it **meets** the **needs** of its **users**.

# Types of System Architectures

- There are several types of system architectures that are used in systems development.
  - They include monolithic, client-server, peer-to-peer, and distributed architectures.
  - Each type of architecture has its own advantages and disadvantages that depend on the specific requirements of the system.
- Handwritten note: need technologies?*

# Types of System Architectures

- There are several types of system architectures that are used in systems development.
- They include monolithic, client-server, peer-to-peer, and distributed architectures.
- Each type of architecture has its own advantages and disadvantages that depend on the specific requirements of the system.

# Types of System Architectures

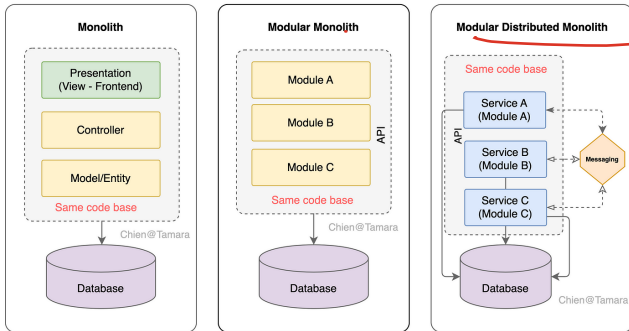

- There are several types of system architectures that are used in systems development.
- They include monolithic, client-server, peer-to-peer, and distributed architectures.
- Each type of architecture has its own advantages and disadvantages that depend on the specific requirements of the system.

# Monolithic System Architecture

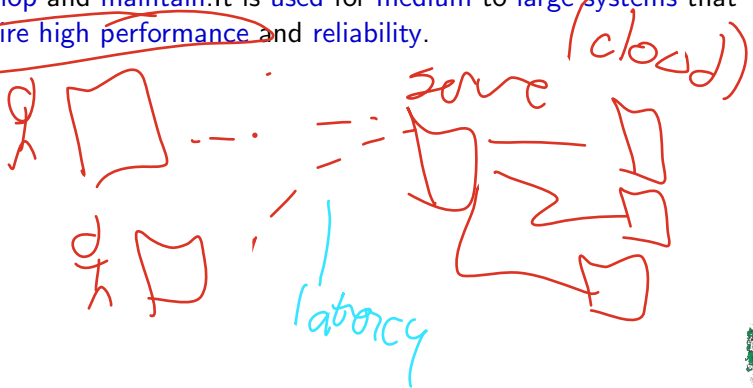

- A **monolithic system architecture** is a single-tier architecture that consists of a single unit that performs all the functions of the system.
- It is simple, easy to develop, and maintain, but it is not scalable and flexible. It is used for small systems that do not require high performance or reliability.

MVC

# Client-Server System Architecture

- A **client-server system architecture** is a ~~two-tier architecture~~ that consists of a **client** and a **server** that **communicate** with each other over a **network**.
- It is ~~scalable~~, flexible, and efficient, but it is **complex** and **difficult** to **develop** and **maintain**. It is **used** for **medium** to **large** systems that **require high performance** and **reliability**.

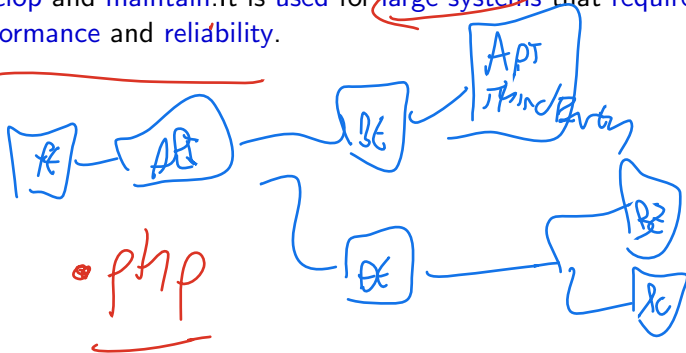

# Peer-to-Peer System Architecture

- A **peer-to-peer system architecture** is a **two-tier architecture** that consists of a **network of peers** that **communicate** with each other directly.
- It is **scalable**, **flexible**, and **efficient**, but it is **complex** and **difficult** to **develop** and **maintain**. It is used for **medium** to **large systems** that require **high performance** and **reliability**.

# Distributed System Architecture

- A **distributed system architecture** is a **multi-tier architecture** that consists of a **network of nodes** that **communicate** with each other over a **network**.
- It is **scalable**, **flexible**, and **efficient**, but it is **complex** and **difficult** to develop and maintain. It is **used** for **large systems** that require high performance and **reliability**.
