3 Abstraction and Modularity /

Outline

- 1 Basic Concepts
- 2 Chaos and Dynamic Systems
- 3 Abstraction and Modularity

What is a System?

- A **system** is a set of interacting components that work together to achieve a common goal.
- A **system** is a collection of elements organized in a specific way.
- A **system** is a structure designed to perform a specific function.

Systems Analysis Process

- **Systems analysis** is the *process* of **studying** a **system** in order to identify its **components**, **interactions**, and **goals**.
- Systems analysis is the *process* of understanding how a system works and how it can be improved.
- Systems analysis is the first step in the system development lifecycle.

Systems Analysis Process

- **Systems analysis** is the *process* of **studying** a **system** in order to identify its **components**, **interactions**, and **goals**.
- **Systems analysis** is the *process* of **understanding** how a **system works** and how it can be **improved**.
- Systems analysis is the first step in the systems development lifecycle.

- **Systems analysis** is the *process* of **understanding** how a **system works** and how it can be **improved**.
- **Systems analysis** is the **first step** in the **systems development lifecycle**.

Systems Development Lifecycle

- The **systems development lifecycle** is a *process* that *guides* the development of a *system*.
- It includes *planning*, *analysis*, *design*, *implementation*, and *maintenance* phases.
- It is a **structured approach** to developing a *system* that *ensures* it meets the *needs* of its *users*.

Systems Analysis Techniques

- **Systems analysis** uses a variety of techniques to study a system.
- These include interviews, surveys, observations, and document analysis.
- It also includes data modeling, process modeling, and requirements analysis.

Lateral Thinking

- **Lateral thinking** is a **creative** problem-solving technique that involves **thinking outside the box**.
- It is a **non-linear** approach to **problem-solving** that *encourages* **innovation** and **creativity**. **→ Engineers**
- It is a *useful* **technique** for *generating* **new ideas** and **solving complex problems**.
- Examples:
 - How can you improve the design of a product?
 - What are the benefits of failure?
 - Why is ignorance important?
 - When is failure better than success?

Lateral Thinking Training

- **Lateral thinking** is a *skill* that can be learned and developed through training and practice.
- It involves exercises, games, and activities that encourage creative thinking.
- Examples of lateral thinking exercises:
 - Brainstorming sessions.
 - Mind mapping exercises.
 - Role-playing games.
 - Problem-solving activities.

World War II, the perspective of Abraham Wald:

Uncertainty and Risk

- **Uncertainty** is the lack of knowledge about the future outcome of a decision or event.

- Risk is the probability of a negative outcome or loss associated with a decision or event.
- Uncertainty and risk are inherent in complex systems and decisions.
- They can be managed through planning, analysis, and mitigation strategies.

- **Uncertainty** and **risk** are *inherent* in **complex systems** and **decisions**.
- They can be managed through planning, analysis, and mitigation strategies.

Complexity and Emergence

- **Complexity** is the **degree** to which a **system** is **difficult** to **understand**.
- Emergence is the appearance of unexpected properties in a system that arise from the interactions of its components.
- Complexity and emergence are common in dynamic systems that are non-linear and chaotic.
- They can be studied and understood through systems analysis and modeling.

Complexity and Emergence

- **Complexity** is the degree to which a system is difficult to understand.
- **Emergence** is the appearance of unexpected properties in a system that arise from the interactions of its components.

- Complexity and emergence are common in dynamic systems that are non-linear and chaotic.
- They can be studied and understood through systems analysis and modeling.

Outline

- 1 Basic Concepts
- 2 Chaos and Dynamic Systems
- 3 Abstraction and Modularity

What is Chaos?

- **Chaos** is a branch of mathematics that studies the sensitivity of dynamical systems to initial conditions.
- **Chaos** is a non-linear behavior that is highly sensitive to initial conditions.

→ Chaos is a deterministic behavior that is not predictable in the long term.

→ Chaos is a complex behavior that is hard to understand.

What is Chaos?

- **Chaos** is a *branch* of **mathematics** that *studies* the **sensitivity** of dynamical systems to **initial conditions**.
- **Chaos** is a **non-linear** behavior that is **highly sensitive** to **initial conditions**.
- **Chaos** is a **deterministic** behavior that is **not predictable** in the **long term**.
- **Chaos** is a **complex** behavior that is **hard to understand**.

Order ———— Disorder

Chaos is Everywhere!

What is a Dynamic System?

- A dynamic system is a system that changes over time t
- A dynamic system is sensitive to initial conditions.
- A dynamic system is non-linear.
- A dynamic system can be chaotic.

What is a Dynamic System?

- A **dynamic system** is a system that **changes** over time.
- A **dynamic system** is **sensitive** to **initial conditions**.
- A **dynamic system** is **non-linear**.
- A **dynamic system** can be **chaotic**.

Chaotic Attractors

A **chaotic attractor** is a set of points in a phase space that attracts the trajectories of a dynamical system. One of the most famous chaotic attractors is the Lorenz attractor, discovered by *Edward Lorenz* in 1963 while studying a simplified model of atmospheric convection. It is defined by the following set of differential equations:

$$\frac{dx}{dt} = \rho(y - x)$$

$$\frac{dy}{dt} = x(\rho - z) - y$$

Swarm Intelligence I

ejemplo

- **Swarm Intelligence** is the collective behavior of **decentralized, self-organized systems**, natural or artificial.
 - The concept is employed in work on **artificial intelligence**.
 - The expression was introduced by Gerardo Beni and Jing Wang in 1989, in the context of cellular robotic systems. For example, watch this **video**.
- artificial life

Swarm Intelligence I

- **Swarm intelligence** is the collective behavior of *decentralized, self-organized systems*, natural or artificial.

- The expression was introduced by Gerardo Beni and Jing Wang in 1989, in the context of **cellular robotic systems**. For example, watch this **video**.

low
cost

Swarm Intelligence II

Useless

- The idea is: if you observe an individual, it may seem random; however, several individuals interacting with each other and the environment show intelligent behaviors.
- There are interesting population behaviors in nature, especially in insects: bees, ants, termites, among others.
- There are also many examples in nature: schools of fish, birds, wolves.

emergent

Swarm Intelligence II

- The **idea** is: if you observe an **individual**, it may seem random; **however**, several **individuals interacting** with each other and the environment show **intelligent behaviors**.
- There are interesting **[population behaviors]** in nature, especially in **insects**: bees, ants, termites, among others.
- There are also many **examples** in **nature**: schools of fish, birds, wolves.

Swarm Intelligence III

Emergent Behaviors

- Emergent behavior is the **appearance** of **complex patterns** and behaviors from **many** simple interactions.
- Emergent behavior **results** from the **collective** behavior of the **individuals** in the system.
- Emergent behavior is **not planned** or **designed** by any individual, but **arises** from their **interactions**.
- Emergent behavior is **not** the **sum** of the **individual** behaviors, but **something more**: **synergy**.
- **Swarm intelligence** refers to interesting **emergent behaviors**.

School Fish Algorithm

School Fish Algorithm

- **School fish** are interesting. When a predator attacks, they become confused by the large number of individuals and their **diverse movements**.

- The idea is simple: *"Don't touch me, don't come too close, but stay somewhat close."*
- This behavior creates a chain of action and reaction. It confuses predators and helps the school move uniformly.
- Do you remember Nemo the fish with the sword and the pirates, or Marlins imitation of a shark? It's somewhat similar. Watch [here](#).
- The school fish algorithm is a multi-agent system that simulates the behavior of a school of fish.

School Fish Algorithm

- **School fish** are interesting. When a predator attacks, they become confused by the large number of individuals and their **diverse movements**.
- The **idea** is simple: *"Don't touch me, don't come too close, but stay somewhat close."*
- This behavior creates a **chain of action and reaction**. It **confuses predators** and helps the school move uniformly.

- This behavior creates a **chain of action and reaction**. It **confuses predators** and helps the school move uniformly.
- Do you remember **Nemo**? The fish with the sword snout, the **pirates**, or **Marlins** imitation of talking-all are somewhat similar. Watch **here**.
- The **school fish algorithm** is a **multi-agent system** that **simulates** the behavior of a **school of fish**.

FO's

Ant Colony Algorithm

ACO

- The ant colony algorithm is a **multi-agent system** that **simulates** the behavior of an **ant colony**.
- The ant colony algorithm is based on the **social behavior** of ants and the use of **pheromones**. Watch here.
- The ant colony algorithm is used to solve optimization problems. Watch here.

Ant Colony Algorithm

- The **ant colony algorithm** is a **multi-agent system** that **simulates** the behavior of an **ant colony**.
- The **ant colony algorithm** is based on the **social behavior** of **ants** and the use of **pheromones**. Watch **here**.
- The **ant colony algorithm** is used to **solve optimization problems**. Watch **here**.

Outline

- 1 Basic Concepts
- 2 Chaos and Dynamic Systems
- 3 Abstraction and Modularity

What is Abstraction?

- **Abstraction** is the process of excluding minor details in order to focus on the important aspects of a system.

- Abstraction is the process of simplifying a complex system in order to understand it better.
- Abstraction is the process of generalizing a specific system to apply it to other systems.

What is Abstraction?

- **Abstraction** is the *process* of **excluding** minor **details** in order to **focus** on the **important aspects** of a **system**. *o.o.p.*
- **Abstraction** is the *process* of **simplifying** a **complex system** in order to **understand** it better.
- **Abstraction** is the *process* of **generalizing** a **specific system** to **apply** it to **other systems**.

- **Abstraction** is the *process* of **generalizing** a **specific system** to **apply** it to **other systems**.

What is Modularity?

- **Modularity** is the process of dividing a system into smaller parts called modules.

- **Modularity** is the process of organizing a system into independent units that can be developed and maintained separately.

- **Modularity** is the process of reducing the complexity of a system by breaking it into smaller parts.

What is Modularity?

- **Modularity** is the *process* of **dividing** a **system** into **smaller parts** called **modules**.
- **Modularity** is the *process* of **organizing** a **system** into **independent units** that can be **developed** and **maintained** separately.
- **Modularity** is the *process* of **reducing** the **complexity** of a **system** by **breaking** it into **smaller parts**.

What is Modularity?
