SOLID Principles

- **Single Responsibility Principle (SRP):** A class should have only one reason to change.
- **Open/Closed Principle (OCP):** A class should be open for extension, but closed for modification.
- **Liskov Substitution Principle (LSP):** Objects in a program should be replaceable with instances of their subtypes without altering the correctness of that program.
- **Interface Segregation Principle (ISP):** A client should never be forced to implement an interface that it doesn't use or clients shouldn't be forced to depend on methods they do not use.
- **Dependency Inversion Principle (DIP):** High-level modules should not depend on low-level modules. Both should depend on abstractions. Abstractions should not depend on details. Details should depend on abstractions.

Good Practices

- **Composition over Inheritance:** Inheritance should be used **only when there is a clear relationship** between the base class and the derived class. In other cases, **composition** should be used. Inheritance is a powerful tool, but it is not always the best tool for the job. Inheritance is a way to achieve polymorphism, but it is **not the only way to achieve polymorphism**.
- **Code to Interfaces, not Implementations:** This principle is about designing your classes so that they **depend on interfaces** rather than concrete classes.
