Outline

- 1 Fundamentals of Machine Learning
- 2 Supervised Machine Learning
- 3 Unsupervised Machine Learning

Outline

- 1 Fundamentals of Machine Learning
- 2 Supervised Machine Learning
- 3 Unsupervised Machine Learning

Key Concepts in Machine Learning

Machine Learning

- **Machine learning** is a method of data analysis that automates analytical model building.
- It is a **branch** of artificial intelligence based on the idea that systems can learn from data, identify patterns and make decisions with minimal human intervention.

Typical Machine Learning Problems

- **Classification:** Predicting a label.

Supervised

- **Regression:** Predicting a continuous value.

- **Clustering:** Grouping similar data points.

- **Dimensionality Reduction:** Reducing the number of features.

- **Anomaly Detection:** Identifying unusual data points.

- **Association Rule Learning:** Identifying relationships between variables.

Algorithmic Bias

- **Algorithmic bias** is a **systematic error** in a model that results in **unfair outcomes**.
- It can be caused by **biased training data**, **biased algorithms**, or **biased decision-making**.

Introduction to Supervised Machine Learning

Definition

- **Supervised learning** is a type of **machine learning** where the model is trained on **labeled data**.
- It involves **training** a model to **map input data to output data** based on example **input-output pairs**.

$f(x,y)$
↓ map

$f(\theta, x)$

Overfitting and Underfitting

Overfitting

Overfitting occurs when a model learns the training data too well and performs poorly on new data.

Underfitting

Underfitting occurs when a model is too simple to capture the underlying structure of the data.

$$2 + 2 = 4$$

Train

$$7 + 4 = 11$$

$$29992 + 99532 = ?$$

Test

	Train	80	20	Test

4	—	3	1	
9	—	4	2	
10	—	8	2	

Overfitting and Underfitting

Overfitting

Overfitting occurs when a model learns the training data too well and performs poorly on new data.

Underfitting

Underfitting occurs when a model is too simple to capture the underlying structure of the data.

Supervised Learning Datasets

- **Training Dataset:** The data used to **train the model**.
- **Validation Dataset:** The data used to **tune** the model **hyperparameters**.
- **Test Dataset:** The data used to **evaluate** the model **performance**.

Supervised Learning Datasets

- **Training Dataset:** The data used to **train the model**.
- **Validation Dataset:** The data used to **tune the model hyperparameters**.
- **Test Dataset:** The data used to **evaluate the model performance**.

Supervised Learning Datasets

- **Training Dataset:** The data used to **train the model**.
- **Validation Dataset:** The data used to **tune** the model **hyperparameters**.
- **Test Dataset:** The data used to **evaluate** the model **performance**.

Cross-Validation

- **Cross-validation** is a technique for **assessing the performance** of a model.
- It involves **splitting** the data into multiple subsets, training the model on some subsets, and evaluating it on others.
- Common cross-validation **techniques** include **k-fold cross-validation** and **leave-one-out cross-validation**.
- Cross-validation helps to **reduce overfitting** and provides a more **accurate estimate** of the model's **performance**.

K-Nearest Neighbors

- **K-Nearest Neighbors (KNN)** is a simple algorithm that stores all available cases and classifies new cases based on a **similarity measure**.
- It can be used for both **classification** and **regression** tasks.
- For **classification**, the output is the **class label** of the majority of the k-nearest neighbors.

Linear Regression with Least Squares

Linear Regression

- **Linear regression** is a type of **regression analysis** used for predicting the value of a **continuous dependent variable**.
- It works by finding the **line that best fits the data**.

Least Squares

Least squares is a method for finding the **best-fitting line** by **minimizing the sum** of the squared differences between the **predicted** and **actual** values.

Linear Regression with Least Squares

Linear Regression

- **Linear regression** is a type of **regression analysis** used for predicting the value of a **continuous dependent variable**.
- It works by finding the **line that best fits the data**.

Least Squares

Least squares is a method for finding the **best-fitting line** by **minimizing the sum** of the squared differences between the **predicted** and **actual** values.

Decision Trees

- **Decision trees** are a type of **machine learning model** that can be used for both **classification** and **regression** tasks.
- They work by recursively **partitioning** the data into **subsets** based on the values of the features.

Random Forest

- **Random forest** is an **ensemble learning** method that combines **multiple decision trees** to create a strong predictive model.
- It works by building **multiple trees** and averaging their predictions to **reduce overfitting**.

Neural Networks

- **Neural networks** are a type of **machine learning model** inspired by the **human brain**.
- They consist of **layers** of interconnected nodes that process **input data** and produce **output data**.

Outline

- 1 Fundamentals of Machine Learning
- 2 Supervised Machine Learning
- 3 Unsupervised Machine Learning

Introduction to Unsupervised Machine Learning

Definition

- **Unsupervised learning** is a type of **machine learning** where the model is trained on **unlabeled data**.
- It involves finding **patterns** and **relationships** in the data without any predefined labels.

Clustering

- **Clustering** is a type of **unsupervised learning** that involves **grouping** similar **data points** together.
- Common clustering algorithms include **k-means**, **hierarchical clustering**, and **DBSCAN**.

K-means

- **K-means** is a popular **clustering algorithm** that partitions the data into K **distinct clusters** based on feature similarity.
- It works by iteratively assigning data points to the nearest **cluster centroid** and updating the centroids based on the assigned points.

Anomaly Detection

- **Anomaly detection** is a type of **unsupervised learning** that involves identifying **unusual data points** in a dataset.
- Common anomaly detection algorithms include **Isolation Forest**, **One-Class SVM**, and **Autoencoders**.

Autoencoders

- **Autoencoders** are a type of **neural network** used for unsupervised learning.
- They work by **encoding** the input data into a lower-dimensional representation and then **decoding** it back to the original data.

Dimensionality Reduction

- **Dimensionality reduction** is a technique for **reducing** the number of **features** in a dataset while retaining as much information as possible.
- Common dimensionality reduction techniques include **Principal Component Analysis (PCA)** and **t-Distributed Stochastic Neighbor Embedding (t-SNE)**.

Principal Component Analysis (PCA)

- **Principal Component Analysis (PCA)** is a **statistical technique** used for **dimensionality reduction**.
- It works by transforming the data into a **new coordinate system** where the greatest variance lies along the first principal **component**, the second greatest variance along the second principal **component**, and so on.
