What is Systems Engineering?

- **Systems Engineering** is a **discipline** that studies the **design**, **implementation**, and **maintenance** of **complex systems**.
- This **discipline** is based on interdisciplinary fields, such as control engineering, industrial engineering, software engineering, mechanical engineering, electrical engineering, organizational studies, project management, and others.
- **Systems Engineering** is a holistic approach to engineering that focuses on how to **design** and manage **complex systems** over their lifecycle.

Deploy

Systems Engineer as a Professional

- A **Systems Engineer** is a professional who is responsible for designing, implementing, and maintaining complex systems.
- A Systems Engineer must have a broad understanding of engineering, mathematics, science, and technology.
- A Systems Engineer must be able to analyze and solve problems in a systematic and holistic way.

Outline

- 1 Basic Concepts
- 2 Human Activities**
- 3 Cibernetics and Technology
- 4 Teams-Based Structure as a System

Human Activities

- Human activities are complex systems that involve multiple components, interactions, and feedback loops.

- Systems Engineering can be applied to understand, analyze, and improve human activities.

- Systems Engineering can help us design and manage complex systems such as organizations, cities, economies, and societies.

Game Of Life

live - 3 → live
 live < 3 → dead
 > 3 → dead
 dead → 3 → live

Human Activities

- **Human activities** are complex systems that involve multiple components, interactions, and feedback loops.
- **Systems Engineering** can be applied to understand, analyze, and improve human activities.
- Systems Engineering can help design and manage complex systems such as organizations, cities, economies, and societies.

Human Activities: Complexity

- **Human activities** are **complex systems** that involve **multiple components, interactions, and feedback loops**.
- **Interactions** are key to understanding and improving human activities.
- **Organizations** are complex systems that involve multiple departments, teams, and individuals.

Human Activities: Complexity

- **Human activities** are complex systems that involve multiple components, interactions, and feedback loops.
- **Interactions** are key to understanding and improving human activities.
- **Organizations** are complex systems that involve multiple departments, teams, and individuals.

Human Activities: Complexity

- **Interactions** are key to understanding and improving human activities.
- **Organizations** are complex systems that involve multiple departments, teams, and individuals.

Organizations as Systems

- **Organizations** can be **viewed** as: a **rational system**, a **natural system**, or an **open system**.
- A **rational system** is a formal organization that is designed to achieve specific goals as a machine.
- A **natural system** is an informal organization that is emergent and adaptive based on human interactions.
- An **open system** is an organization that is interconnected with its environment and adapts to changes.

Organizations as Systems

- **Organizations** can be viewed as: a rational system, a natural system, or an open system.
- A **rational system** is a formal organization that is designed to achieve specific goals as a machine.

• A **natural system** is an informal organization that is emergent and adaptive based on human interactions.

• An **open system** is an organization that is interconnected with its environment and adapts to change.

Sinergy

- **Sinergy** is a simple but powerful concept: the aim of the parts is more than the parts itself.

- It means the **interactions** could boost the capabilities of the parts of the system. Also, it lets both understand **emergent behaviors** and define improvements in **systems**.

- One of the main concepts is the **theory of the computation**. Based on graphs, you could define a **computational machine**.

Figure: Prompt: Define a draw of clusters in social networks.

The Outliers

Talking with Machines!

Alan Turing (1912-1954)
 ↳ Babbage Machine
 ↳ State Machine

- Alan Turing proposed a hundred years ago an Universal Machine, capable of take any algorithm defined as a state machine, and process it in a binary language.

Thesis Turing-Chomsky
 Chomsky proposed the formal
 Algorithm based on generative
 grammars. Here is where the
 high-level programming
 languages appear.

Applications of Systems Engineering

Qubits

- **Systems Engineering** can be applied to understand, analyze, and improve complex systems.
- **Systems Engineering** can be applied to design and manage complex systems such as organizations, cities, economies, and societies.
- **Systems Engineering** can be applied to design and manage complex systems such as software, hardware, and networks.

Outline

- 1 Basic Concepts
- 2 Human Activities
- 3 Cibernetics and Technology**
- 4 Teams-Based Structure as a System

Cibernetics

- **Cibernetics** is the study of systems, control, and communication in animals, machines, and organizations.
- Cibernetics is a transdisciplinary field that combines engineering, mathematics, biology, psychology, and philosophy.
- Cibernetics is the foundation of systems engineering and information technology.

Cibernetics

- **Cibernetics** is the study of systems, control, and communication in animals, machines, and organizations.
- **Cibernetics** is a transdisciplinary field that combines engineering, mathematics, biology, psychology, and philosophy.
- **Cibernetics** is the foundation of systems engineering and information technology.

Cibernetics

- **Cibernetics** is the study of systems, control, and communication in animals, machines, and organizations.
- **Cibernetics** is a transdisciplinary field that combines engineering, mathematics, biology, psychology, and philosophy.
- **Cibernetics** is the foundation of systems engineering and information technology.

Technology

- **Technology** is the application of scientific knowledge to solve problems and improve systems.
- Technology is the foundation of systems engineering and information technology.
- Technology is the key to designing and managing complex systems such as organizations, cities, economies, and societies.

Technology

- **Technology** is the application of scientific knowledge to solve problems and improve systems.
- **Technology** is the foundation of systems engineering and information technology.
- **Technology** is the key to designing and managing complex systems such as organizations, cities, economies, and societies.

Technology

- **Technology** is the application of scientific knowledge to solve problems and improve systems.
- **Technology** is the foundation of systems engineering and information technology.
- **Technology** is the key to designing and managing complex systems such as organizations, cities, economies, and societies.

Technology: AI

- **Artificial Intelligence** is a field of computer science that studies how to design and implement intelligent agents.
- Artificial Intelligence is the key to designing and managing complex systems such as smart-organizations, smart-cities, smart-economies, and smart-societies.

Technology: AI

- **Artificial Intelligence** is a field of computer science that studies how to design and implement intelligent agents.
- **Artificial Intelligence** is the key to designing and managing complex systems such as smart-organizations, smart-cities, smart-economies, and smart-societies.

Artificial Intelligence **not** as a System

Cibernetics & Technology in Systems Context

- **Cibernetics** and **technology** are the foundation of systems engineering and information technology.
- **Cibernetics** and **technology** are the foundation of artificial intelligence and smart systems.

Outline

- 1 Basic Concepts
- 2 Human Activities
- 3 Cibernetics and Technology
- 4 Teams-Based Structure as a System

Team-Based Structure Organizations

- **Team-based structure organizations** are a way to **organize work** and **people** in **teams** that are **self-managed** and **cross-functional**.
- Each team is **responsible** for a **specific task** or **project** and has the **authority** to **make decisions** and **solve problems**.
- **Team-based structure organizations** are **flexible**, **agile**, and **innovative** because they **empower employees** and **encourage collaboration**.

Team-Based Structure Organizations

- **Team-based structure organizations** are a way to **organize work** and **people** in **teams** that are **self-managed** and **cross-functional**.
- Each team is **responsible** for a **specific task** or **project** and has the **authority** to **make decisions** and **solve problems**.
- **Team-based structure organizations** are **flexible**, **agile**, and **innovative** because they **empower employees** and **encourage collaboration**.

Team-Based Structure Organizations

- **Team-based structure organizations** are a way to **organize work** and **people** in **teams** that are **self-managed** and **cross-functional**.
- Each team is **responsible** for a **specific task** or **project** and has the **authority** to **make decisions** and **solve problems**.
- **Team-based structure organizations** are **flexible**, **agile**, and **innovative** because they **empower employees** and **encourage collaboration**.

Teams as a System

- **Teams** are a **system** where collaboration (sinergy) and communication are **key** to **success**.
- Define and automate the **processes** and **procedures** in the **team** is a **challenge** to **improve** the **team** **performance**.
- **Teams** are a like a **pieces** in a **puzzle**, where each **piece** has a **specific** **role** and **responsibility**.

Teams as a System

- **Teams** are a **system** where collaboration (sinergy) and communication are **key** to **success**.
- Define and automate the **processes** and **procedures** in the **team** is a **challenge** to **improve** the **team performance**.
- Teams are a like a **pieces** in a **puzzle**, where each **piece** has a specific role and responsibility.

Teams as a System

- **Teams** are a **system** where collaboration (sinergy) and communication are **key** to **success**.
- Define and automate the **processes** and **procedures** in the **team** is a **challenge** to **improve** the **team performance**.
- **Teams** are a like a **pieces** in a **puzzle**, where each **piece** has a **specific role** and **responsibility**.

Soft Skills

- **Soft skills** are **personal attributes** that enable someone to **interact** effectively and harmoniously with other **people**.
- Typical Soft Skills:
 - **Communication** skills (verbal and written).
 - **Teamwork** and collaboration.
 - **Problem-solving** and critical thinking.
 - **Adaptability** and flexibility.
 - **Time management** and organization.
 - **Leadership** and management.
 - **Emotional intelligence**.
 - **Creativity** and innovation.
 - **Conflict resolution**.
 - **Networking** and relationship building.
 - **Customer service** and client management.

Computer Analyst

● Skills:

- Business process modeling and documentation.
- Data analysis and interpretation.
- Requirements gathering and management.
- Stakeholder management.

● Responsibilities:

- Analyzing business processes and identifying areas for improvement.
- Gathering and documenting business requirements.
- Collaborating with stakeholders to define project scope and objectives.
- Creating and maintaining project documentation, such as functional specifications and use cases.
- Facilitating communication between business users and technical teams.
- Participating in system testing and user acceptance testing.
- Providing support and training to end users.

Tech Company Typical Structure

Feature Teams

What is to be a leader? I

- **Leading** a team is **not a role**. It is a decision, you could be a **leader** anytime and anywhere.
- **Teamwork culture** is pretty **important**. It creates habits, open communication, safety spaces for inclusion.
- **Psychological safety** is a **key** point to have an **effective** team. You could develop *technical skills*, but **it is not enough**.
- **Hierarchy** is very important. **Anarchism** tends to fail. Hierarchy exists by **status** and **power**.
- In a **hierarchy experts lead** to make **better decisions**. However, anyone must be **careful** to not leave people behind.

What is to be a leader? I

What is to be a leader? II

- With **crystal-clear communications** and clarity about **business goals** and achievements, people feel **more comfortable** pursuing the same **goals** as a **team**.
- A **good leader** should focus on **outcomes** rather than **outputs**. This helps bring **business value** rather than **just complete tasks**.
- **Failure** is always an **option**. Learn how to **deal** with **srtbacks**; do not punish — just **fix and learn**.
- Some believe you're **born a leader**, while others think that a leader can be **devveloped** over time. Either way, **context** and **the desire** for self-growth are **vital**.
- Making **ethical decisions** is **key**; it leads to taking the **right** and **better actions**.
